Introduction

Tuition centres often manage student records and class bookings manually, which can be time-consuming and inefficient.

Manual systems can lead to **data redundancy, booking conflicts, and human errors**. Information may be duplicated, lost, or incorrectly recorded, which affects the overall efficiency of tuition centre operations and can cause inconvenience to both administrators and students.

Motivation

This project is motivated by the need to automate tuition management using a centralized database system. The system aims to improve efficiency, ensure data accuracy, and provide a convenient platform for both administrators and students.

System Scope

Web based tuition management system, with two user roles:

- Admin
- Student

Both users can manage student records, tutor assignments, booking class, viewing class scheduling.

Students can also book a one-by-one tutor by booking a class with the preferred tutor.

Technology Stack

- Frontend: HTML, CSS, Bootstrap
- Backend: PHP
- Database: MySQL
- Server Environment: Laragon (Apache)
- Database Management: phpMyAdmin

Functional Requirements

- Admin Functions
 - Add, edit, delete student records
 - Manage tutors and classes
 - View and manage bookings
- Student Functions
 - Book available classes
 - View booking history and status

Non-Functional Requirements

- Secure login using session-based authentication
- Data integrity enforced by foreign keys
- User-friendly and responsive interface
- Proper error handling and validation

OUR ERD

Conclusion

By automating the booking process and centralizing data management, the system reduces **manual errors** and **improves** operational efficiency for administrators while offering students a convenient way to book classes online. Tuition Management and Class Booking System successfully meets its objectives by **providing a structured and efficient platform** for managing student records, classes, and bookings. The system implements a well-designed relational database with full CRUD functionality, ensuring data integrity through the use of primary and foreign key constraints.
